

BLOOD TESTING FOR ALLERGIES

A blood test, also called a specific IgE test, is a powerful allergy diagnostic tool that measures the concentration of specific IgE antibodies in the blood. It can test for hundreds of allergic triggers, such as pollen, mold, food and animal dander. This is a quick and reliable way to get accurate results about your unique allergic triggers.

Identifying your allergic triggers can help you:

- Control allergic asthma and allergic rhinitis
- Prevent the use of avoidable medications
- Reduce your number of office visits
- Optimize care and manage your health risks
- Reduce costs associated with missed work or school
